Level

# **Mobrey** MCU900 Series industrial transmitter control unit

Software version 2.0

MCU900 is the generic name used in this manual for the MCU900 range of control units comprising :-

MCU901	MCU901 24V
MCU902	MCU902 24V
MCULOG	MCULOG 24V
MCU90F	MCU90F 24V

**(E** 

## **Safety Precautions**

The following safety precautions should be observed before using this product or working on the attached cables.

This MCU900 product is intended for use by qualified personnel who recognise shock hazards and are familiar with the safety precautions required to avoid possible injury. Read the operating information carefully before using the product.

The types of product users are:

**Responsible body:** This is the individual or group responsible for the use and maintenance of equipment, and for ensuring that operators are adequately trained.

**Operators** use the product for its intended function. They do not require access to the electrical connections within the control box, and would normally only operate the external keypad and monitor the display.

**Maintenance personnel** perform routine procedures on the product to keep it operating, for example, checking the line voltage or checking electrical connections, replacing mains fuses etc.

**Service personnel** are trained to work on live circuits, and perform safe installations and repairs of products. Only properly trained service personnel may perform installation and service procedures. However, the only serviceable part in MCU900 is the mains cartridge fuse.

Users of this product must be protected from electric shock at all times. Product users must be trained to protect themselves from the risk of electric shock.

MCU900 Control Units are double insulated and do not require a mains earth.

Periodically inspect the connecting cables for possible wear, cracks, or breaks.

The fuse must only be replaced with same type and rating for continued protection against fire hazard.

To clean the instrument, use a damp cloth with a mild, water based cleaner. Clean the exterior of the instrument only. Do not allow liquids to enter or spill on the instrument.

**WARNING** - If this equipment is used in a manner not specified by Mobrey Measurement, the protection provided may be impaired. The MCU900 is regarded as permanently installed equipment and as such a double pole switch or circuit breaker must be included in the installation. This should be in close proximity to and not obstructed by the equipment. This must be marked as its disconnecting device.

Disconnect supply before removing cover.

The IP rating is only achieved when unit is correctly assembled with supplied parts and suitable cables. Customer supplied glands must be suitable for application.

Under no circumstances must voltages higher than those stated in this manual be applied.

The installation of the MCU900 and its associated power cables must be such that tank overflow, local flooding or pump failure do not cause these to be submerged or subject to flows of water. Sensors and sensor cabling can be submerged without hazard to equipment operators when correctly connected as described in this manual.

Explanation of symbols:  $(\underline{P})$  = Refer to manual

The I.S. earth terminal, marked  $\perp$  must be connected to an external Intrinsically safe earth for all hazardous area systems.

#### CHECK THAT THE POWER SUPPLY IS SUITABLE BEFORE SWITCHING POWER ON.

Internal adjustments can select mains 115 Volts AC power, which makes the equipment unsuitable for 230V AC supplies. Check this Voltage selection switch is suitable set for the available power supply.

HAZARDOUS AREA SYSTEMS :-

Where the MCU900 is connected to a transmitter located in a hazardous area, additional instructions apply. Refer to page 6 and safety instruction leaflet IP2030/SI.

The symbol  $\langle \epsilon_x \rangle$  in the text of this manual refers the reader to page 6 and safety instruction leaflet IP2030/SI as relevant.

#### Footnote :-

In this manual the following terms are used which refer to trademarks from other manufacturers:

HART: is the protocol adopted for the MCU900 SMART Communications. HART is a registered trademark of the HART Communications Foundation and is a mnemonic for Highway Addressable Remote Transducer.

#### 1.0 Product Introduction

MCU900 is the generic family name for a range of industrial transmitter control units, providing a wide range of control functions and a visual display of the measured variable. There are two mounting styles available; a tough IP65 Wall mounting control unit for either indoor or outdoor installation, and a Panel mounting control unit designed for direct mounting in a control panel. The controller will accept a 4-20mA signal from a self-powered transmitter or can provide 24V dc power to the transmitter if required.

A HART transmitter, powered from the MCU900, can be connected to the MCU900 and all Universal plus some Common Practice commands will be implemented.

The MCU900 may be connected to a 4-20mA transmitter installed in a hazardous area. However, the MCU900 is designed for mounting in a non-hazardous (safe) area.

Control functionality is provided by the 5 SPCO voltage free contact relays in the MCU900. There is also an isolated 4-20mA signal out.

For applications where the functionality of the MCU900 is linked to other external events, 2 digital input ports are provided to accept contact closure signals.

The MCU900 is simply programmed using the 6 key membrane keypad on the front of the unit. Menu structured programming is employed, with the display assisting the user with dynamic help text.

#### 1.1. Control Unit Functions

Using either a standard 4-20mA input or a digital HART input from a transmitter, the MCU900 control unit will provide the following functions :

• Calculation and display of the MCU900 Primary Variable (PV).

The user can choose this to be the reading coming from the transmitter, which may be a depth or distance measurement from a HART ultrasonic transmitter or may be a mA reading from a pressure transmitter, or some other value calculated by the MCU900 based on the transmitter input, which could be a level, distance, contents or flow reading. A totaliser function is also included.

The MCU900 is factory programmed with a set of standard volumetric and flow equations to convert a level signal to contents or flow, and also has a 21 point user programmed look-up table for non-standard applications.

MCU902 units calculated the difference, sum or product of 2 separate 4-20mA inputs. MCULOG units have a 4800 event on board logging capability.

• 4-20mA signal out from the MCU900 control unit.

The MCU900 current output is usually proportional to the displayed PV, and is displayed in bargraph form on the display (0-100%).

• Relay control functions.

There are 5 freely assignable relays. Relay 5 is a fault relay by default, which may be assigned to control duty if required. The other 4 relays are available for the user to programme to operate at chosen values of the displayed PV, or other calculated values.

The MCU900 is factory programmed with a selection of popular pump control routines for wet well and sump control, along with energy saving over-rides.

• Voltage free (digital) contact input

Up to two voltage free contact closure inputs may be connected, allowing external over-ride of control unit functions if desired.

• Programming a transmitter from the MCU900 control unit

As the MCU900 will communicate digitally with any HART compatible transmitter powered by the MCU900, it is possible to programme a HART transmitter using the MCU900 keypad.

Full communication with Mobrey HART ultrasonic transmitters, allowing access to all transmitter parameters is supported, whilst Universal and some Common Practice commands of other HART transmitters is possible in accordance with HART protocol.

#### 2.0 Mobrey MCU900 Series Controller

2.1 Display and Keypad (Model MCU900P shown)

#### Figure 1 : MCU900 keypad and LCD display

Note : The keypad, display and operation are common to both Wall and Panel mounting options.

The MCU900 display is fully field configurable and may be customised to suit the requirements of the user.

Typically the 4 line display is as shown in Figure 2, The top line shows whether the programme lock is open together with the time display. The actual measurement, the MCU900 Primary Variable (PV) is displayed in the centre using double height characters. The lower line shows a bargraph representation of the 4-20mA current output of the control unit, proportional to the PV, 0-100%.

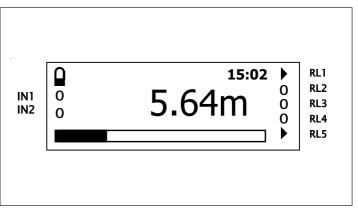

Figure 2 : Typical MCU900 liquid crystal display

Additional flags on the display show the status of the five relay outputs, RL1 to RL5, and of the digital control inputs into the MCU900.

Keypad Operation :

There are 6 buttons on the MCU900 front panel. The four ARROWS allow navigation around the programming menu and the "ESC" and ", " buttons allow movement from one screen to the next. By pressing "ESC" repeatedly, the screen will always return to the normal display as shown in Fig 2. Movement through the menu structure using the arrows is shown by the titles being "highlighted", ie reversed to show white letters on a dark background. The LCD is backlit for operator convenience. (This can be turned off if required).

Some basic introductory programming details are given in Appendix 1, whilst full programming and operating instructions are given in Manual IP2030/OM. Quickstart manuals, are also available, covering use of the MCU900, MCU902, MCULOG and MCU90F with a Mobrey ultrasonic transmitter(s).

#### 2.2 Type Numbering System

- MCU Mobrey Control Unit
  - 901 Standard model
  - 902 Differential model
  - LOG Logging model
  - **90F** Open channel flow model
    - **WX** Wall mounting
    - PX Panel mounting
      - -A ATEX certified, 115V ac/230V ac mains powered-A24 24V dc powered
- 2.3 Safety Data

Type numbers	See above
Certificate number	BAS00ATEX7064 and BAS01ATEX7225X
ATEX Coding	_
(EU Directive 94/9/EC)	⟨٤x⟩    [1] G D

Cenelec Coding [EEx ia] IIC  $-40^{\circ}C \le Ta \le 55^{\circ}C$ 

Safety Parameters

Terminal 1 (24V) w.r.t. terminal 2 (Iin) Terminal 1 (24V) w.r.t. terminal 3 (Earth)	Terminal 2 (Iin) w.r.t. terminal 3 (Earth)	
$\begin{array}{llllllllllllllllllllllllllllllllllll$	$\begin{array}{llllllllllllllllllllllllllllllllllll$	

The capacitance and either inductance or inductance to resistance ratio L/R of the cable and equipment connected to the intrinsically safe output terminals must not exceed the following values :

Group	Capacitance	Inductance	or	L/R Ratio
IIC	0.082*µF	1.2mH		42 μH/Ω
IIB	0.65µF	10.9mH		172 μH/Ω
IIA	2.15µF	21.9mH		346 μH/Ω

\*  $0.082\mu$ F of which total Ci of the hazardous area apparatus connected must not exceed  $0.020\mu$ F.

Terminal 2 ( $I_{IN}$ ) w.r.t. Terminal 3 (Earth) must be treated as a 6.51V source. The 6.51V is considered as being the theoretical maximum to which a capacitive load across these terminals could become charged through leakage through internal series blocking diodes. This voltage does not contribute to the short circuit sparking risk of any external source connected to these terminals.

#### 2.4 Electrical Specifications

Cable Entry	5 x Ø 20mm, (3 blanking plugs, 2 cable glands)					
Cable connections	Cage clamp terminal block, suitable for 2.5mm <sup>2</sup> max cable.					
Supply voltage	Switch selected : Mains - 115Vac, voltage range 98Vac - 127Vac 50- Mains - 230Vac, voltage range 196Vac - 254Vac 50- DC - 24Vdc, voltage range 15Vdc - 30Vdc					
Power consumption	Mains - 10VA at nominal supply voltage Mains - 18VA Max. DC - 9W max					
Fuse	Mains - 200mA (T) 5 x 20mm 250V					
Transmitter input	4-20mA (Earth referenced in MCU900) CAT 1 30V dc Max.					
Digital inputs	Unit accepts two trigger input signals. (Voltage free contact closure)	See "WARNING" in section Safety				
Relay Outputs	5 x SPCO Relays, rated 5 Amp at 250 Vac Resistive Please refer to section 3.7 for safety use.	Precautions on Page 2				
Current Output	4-20 mA isolated into $1k\Omega$ max. If externally powered then max. voltage is 30Vdc					
DC Power Output	24V DC for transmitter, 25mA max. load					
HART	HART digital communications to transmitter					

#### 3.0 MCU900 Control Unit Installation

The control unit must not be mounted in areas where an explosion hazard exists.

 $\varepsilon x$  If connecting the MCU900 to a 4-20mA transmitter located in a hazardous area, refer also to instructions on page 6 and in safety instruction leaflet IP2030/SI.

Refer also to the important safety precautions detailed at the start of this manual.

#### 3.1 Environmental Specification

Ambient temperature	-40°C to 55°C
Max Altitude	2000m
Max Humidity	100% RH
Electrical Safety	Conforms to EN61010-1
Installation Category	III Supply voltage <127Vac II Supply voltage <254Vac
Pollution Degree	2

#### 3.2 MCU900W Wall Mounting models

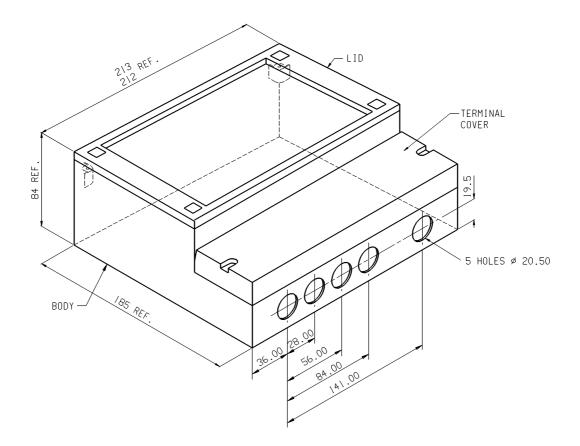

The control unit housing is rated IP65. It is suitable for mounting outside, but this should be above any flood level, away from any overflow water path, and away from direct sunlight. Do not mount the MCU900W on a structure that is subject to vibration, or in a position where damage may be caused by impact, thermal stress or liquid ingress.

The mass of the MCU900W is 1.4kg. To conform with safety requirements, the wall on which the MCU900W is mounted should be capable of supporting 4 times this weight.

It is not necessary or advisable to remove the lid to the upper part of the box, containing the LCD and keypad. There are no user serviceable parts inside. The control unit must not be modified in any way. Mount the unit on a suitable wall or structure using the 3 fixing points as shown in figure 3. The most convenient way is to position the central top fixing first, then hang the control unit on this. Use a spirit level to ensure the unit is horizontal, then mark the two lower fixing positions on the wall. (These are accessible once the terminal cover is removed).

The MCU900W is supplied with IP65 Nylon cable glands for connections to the field mounted transmitter and the mains power supply. MCULOG has an additional connector which is used to download logged data.

It is the responsibility of the user to ensure that cable glands and connection to the MCU900W is in accordance with local or national standards.

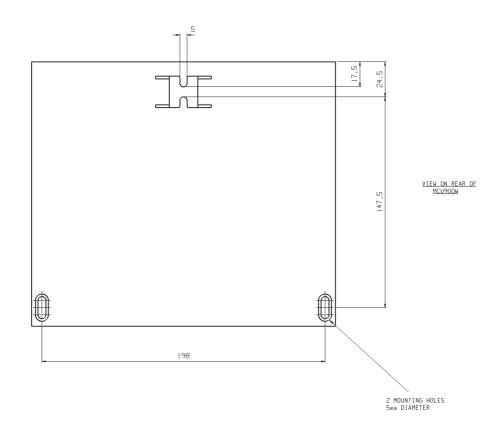

Figure 3 : MCU900W Control Unit Dimensions

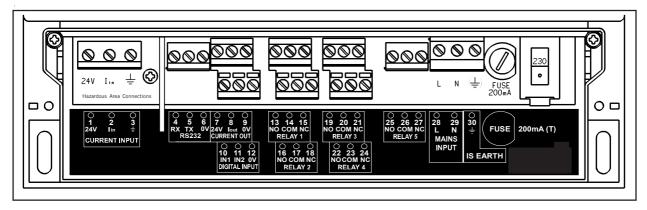

#### 3.2.1 Electrical Connections : MCU900W Wall mounting models

All field wiring connections are accessible by removing the lower terminal cover, which is secured by two screws. Note that it is the responsibility of the installer to observe all local regulations and approval requirements, and to ensure wiring is suitable for the load current and the insulation is suitable for the voltage, temperature and environment of the installation. Obtain and check any hazardous area work permits required before applying power to the MCU900. On no account should the mechanical barriers separating the terminal area from the main enclosure and the transmitter terminals from the other terminals be removed or modified.

The diagram below shows the layout of external connection terminals: all terminal blocks are suitable for wires 0.5mm<sup>2</sup> to 1.5mm<sup>2</sup> (2.5mm<sup>2</sup> for mains terminals). Insulation should be stripped back 7mm.

Two cable glands, rated IP65 and suitable for cable with outside diameter 4mm to 7mm, are supplied for use with the mains supply and transmitter cable. The three other connection positions are supplied with M20 blanking plugs. All glands and plugs are supplied in a separate plastic bag. The installer must fit these, or suitable equivalents, in place of the transit red-caps, to ensure weatherproofing of the MCU900. Note that the white sealing washers supplied with the all cable glands and blanking plugs must be fitted on the outside of the enclosure under the gland or blanking plug. It is the responsibility of the user to ensure suitable cable glands or conduit connections are used when wiring to the MCU900 to maintain the enclosure integrity. The 5 cable entry positions are pre-drilled to accept M20 cable glands. MCULOG has a data download socket factory fitted in one of the positions.

#### Figure 4: Connection Terminal Layout (mains version shown)

Note that not all of the terminals are labelled on the pcb - a wiring label is positioned in the box.

The transmitter connections are on the left side of the terminal enclosure.

The I.S. Earth (Terminal 30) must be connected to an Intrinsically Safe Earth if the transmitter connected to terminals 1 and 2 is located in a hazardous area.

Terminal	Function	Layout
1	Loop supply	24V
2	Current Input	lịn
3	Screen	<u> </u>
4-6	RS232	RX-TX-OV
7-9	Current Output	24V- Iout-OV
10-12	Digital Input 1 & 2	IN1-IN2-OV
13-15	Relay 1	NO-COM-NC
16-18	Relay 2	NO-COM-NC
19-21	Relay 3	NO-COM-NC
22-24	Relay 4	NO-COM-NC
25-27	Relay 5	NO-COM-NC
28-29	Mains Input	L-N (mains version only)
30	IS Earth	
31	Negative	- (DC version only)
32	Positive	+ (DC version only)

#### 3.3. MCU900P Panel mounting models

Do not mount the MCU900P on a panel that is subject to vibration, or in a position where damage may be caused by impact, thermal stress or liquid ingress.

The MCU900P control unit is rated IP40 and is designed for panel mounting in a weatherproof environment. An optional fascia overlay hood is available which improves the IP rating to IP65 (See appendix 1).

A Rack mounting kit is available which allows mounting of an MCU900P in a standard 19" rack. Up to two control units can be mounted in one rack; each MCU900P requires a mounting kit. (See appendix 1).

Where 3 or more MCU900P control units are fitted in the same cabinet or panel, ensure that there is adequate air circulation to aid cooling. It is recommended that an air circulation fan be fitted.

The MCU900P requires at least 165mm clearance behind the mounting panel to avoid fouling.

Once mounted, all wiring is made at the rear of the unit using the two part terminal blocks provided.

A pre-wired logged data download socket suitable for front panel mounting is provided with MCULOG control units.

#### 3.3.1 – Mounting in the panel

Mount the control unit on a panel with thickness between 1.5mm to 10mm, ensuring the panel is strong enought to support the 1.2kg weight of the MCU900.

Ensuring there is enough clearance behind the chosen position in the panel (165mm min.), cut a slot 138mm long by 68mm high (i.e. landscape or horizontal slot) in the panel and remove any rough edges.

Unpack the two screw clips provided. Identify the moulded lugs in the moulded recesses on each side of the control unit (ignore the recesses on the top and bottom of the control unit).

Holding the screwdriver slot end of the threaded spindle of one of the screw clamps and looking at the rear of the control unit, locate the screw clip frame on the side of the control unit and see how the 4 steel lugs of the screw clamp frame locate on the moulded lugs of the control unit. Gently pull the screw clamp such that the lugs engage with each other. (see Figure 5).

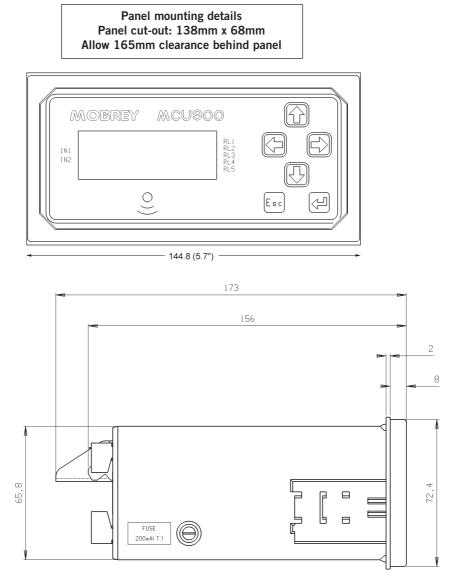

#### Figure5

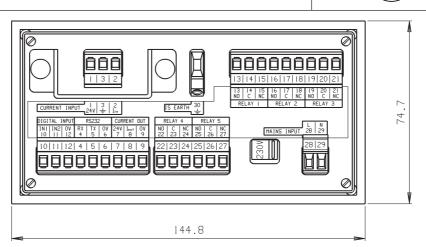

Remove the screw clamp and slide the control unit into the panel, ensuring that the panel seal provided is in place behind the control unit bezel.

Re-fit the screw clamps, one on each side of the control unit and tighten with a screwdriver to clamp the control unit in place against the panel.

#### Figure 6 : MCU900P Control Unit dimensions (mains unit shown)

Logged data download socket : MCULOG control units only. Drill a hole Ø in the panel at a suitable location such that the socket flying leads can be wired to terminals 4, 5 and 6 at the rear of the MCU900P. See page13 for wiring instructions.

11.85

٨

VIEW ON REAR OF MCU900P 3.3.2 Electrical connections : MCU900P Panel mounting models.

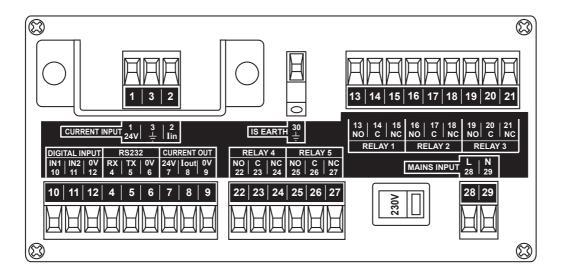

All connections are made at the rear of the control unit using the two part terminal connectors provided. Note that it is the responsibility of the installer to observe all local regulations and approval requirements, and to ensure wiring is suitable for the load current and the insulation is suitable for the voltage, temperature and environment of the installation. Obtain and check any hazardous area work permits before applying power to the MCU900.

Figure 7 below show the layout of the terminal connections. Terminal blocks are suitable for wires 0.5mm<sup>2</sup> to 2.5mm<sup>2</sup>. Insulation should be stripped back 7mm.

Note the protective shield surrounding the transmitter connection terminals (1 - 3). On no account must this shield be damaged or removed as it is an integral part of the Intrinsically Safe design of the MCU900P.

The I.S. Earth (Terminal 30) must be connected to an Intrinsically Safe earth if the transmitter connected to terminals 1 and 2 is located in a hazardous area.

#### Figure 7

Note that the plug/socket connectors are polarised to prevent inter changeability and incorrect connection.

3.4 Notes on transmitter installation and cabling

Connection of a transmitter to the MCU900 does not confer Intrinsic Safety on the transmitter. It is the responsibility of the user to ensure any transmitter installed in a hazardous area is suitable for use and certified accordingly for use in the hazardous area. The installation should be in accordance with a recognised code of practice.

Check the parameters of the installed system of MCU900, transmitter, any loop devices and interconnecting cable to ensure compliance with the individual product certificates and technical data (Refer to page 6).

Particular attention must be given to the cable and the transmitter to ensure that the total capacitance and inductance limits stated in the MCU technical data in Section 2.3 are not exceeded.

Cable joins are allowable in cabling to the transmitter provided that the joint is made within an IP20 (minimum) enclosure suitable for the environment, and that the wiring withstands a test voltage of 500V r.m.s. to earth.

The maximum length of cable permissible between the transmitter and MCU900 is determined by the limits imposed by the intrinsically Safe certificates of the instruments.

No other outputs from the MCU900 must be routed through a hazardous area unless protected by an additional I.S. Barrier.

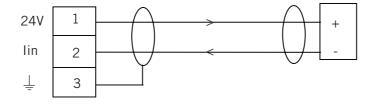

It is the responsibility of the user to ensure that any transmitter is installed in accordance with the manufacturer's instructions supplied with the transmitter.

Cable between the MCU900 and the transmitter should be twisted pair shielded with the shield connected to terminal 3 marked " $\pm$ " in the MCU900. The shield should be left unconnected at the transmitter unless there is a terminal specifically provided for this purpose.

Cable runs should be separate from any high voltage or mains cables to avoid crosstalk or interference.

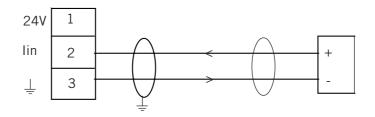

Multicore cable may be used provided that other cores carry only low voltage (24V dc nom) signals and each pair of cores is individually shielded.

Loop powered transmitters must be connected to terminals 1 - 3 as shown below : (Note different arrangement of terminals in MCU900W and MCU900P).

#### Figure 8

The MCU900 is able to provide 24V dc to a transmitter with a max load of 25mA. Separately powered transmitters must be connected to terminals 2 and 3 as shown below :

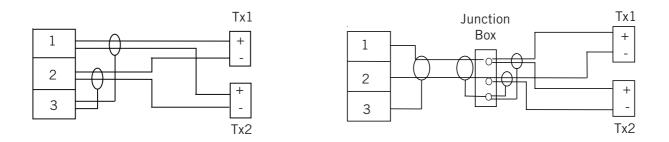

#### 3.4.1

Special notes for connecting HART transmitters (including MSP900SH-A transmitters) to the MCU902 Control Unit.

The MCU902 Control Unit takes the input from two HART transmitters and will perform various calculations to create the sum, difference or product of the two inputs. The transmitters must be HART compatible for the MCU902 to operate correctly.

Connection of the transmitters to the MCU902 may be by cabling both transmitter cables into the MCU902 using the cable glands provided, or may be on a single cable using one of the cable glands provided, with the two transmitters connected to this cable in a suitable local junction box.

#### MCU902 to transmitter connection

For correct operation, each transmitter must be changed to "multi-drop" mode so that they can communicate with the MCU902 through a common connection. Each transmitter must therefore have it's poll address changed from the factory default address of "0" to a unique address. The MCU902 is used to achieve this, but this requires that the transmitters be connected in sequence as detailed below :-

- a) With the power supply turned off, connect the first transmitter to terminals 1-3 in the MCU902 control unit.
- b) Check that the power selector switch is set to the correct voltage (115 or 230 V ac) on mains unit and turn the power supply on.
- c) The MCU902 will detect the transmitter and automatically change the poll address of the transmitter from "0" to "1". This transmitter will also be automatically allocated to Channel 1 of the MCU902.

Note, the MCU902 control unit may also offer the user the opportunity to set the bottom reference of the MSP900SH-A transmitter at this point, which may be done or ignored by pressing the "Esc." Key.

- d) Turn the power supply off and connect the second transmitter, either at the same terminals 1-3 as the first transmitter or at a local junction box, such that both transmitters are now connected.
- e) Turn the power supply back on and the MCU902 will once again search for and detect any transmitters connected. Once the second transmitter is found, the MCU902 will automatically change the poll address from "0" to "2", and the transmitter will also be automatically allocated to Channel 2 of the MCU902. Note, the MCU902 control unit may also offer the user the opportunity to set the bottom reference

Note, the MCU902 control unit may also offer the user the opportunity to set the bottom reference of the MSP900SH-A transmitter at this point, which may be done or ignored by pressing the "Esc." Key.

Installation of the transmitters is now complete.

#### 3.5 Power connection

If the MCU900 is powered by mains AC power, select the AC voltage as 230V or 115V using the voltage selector slide switch.

If dc powered ensure the supply is adequate (15 - 30Vdc). Do not exceed 30Vdc.

A switch or circuit breaker should be installed in close proximity to the instrument, and labelled as such.

Although the MCU900 meets all European standards for surge immunity on power and signal lines, it is recommended that lightning suppressors, such as made by Telematic Ltd., are fitted if local conditions make this advisable.

### 3.6 Earthing $\langle E x \rangle$

MCU900 control units are double insulated and DO NOT require a mains earth.

DO NOT connect a mains earth to terminal 30.

Terminal 30 is provided for use as an Intrinsically Safe (or functional) earth connection which MUST be used when a transmitter is mounted in a hazardous area and is connected to terminals 1 & 2.

Terminal 3 is to be used for connection of the shield of the twisted pair transmitter cable when the MCU900 is powering the transmitter. See Fig. 8 and 9. Note that this shield should be left unconnected at the transmitter end unless there is a terminal provided specifically for this purpose.

#### 3.7. Relays

The 5 voltage free contact relays are grouped in the following configuration :

MCU900W Wa	MCU900W Wall Mount Control Unit			Moun	t Control Unit
Relay 1 & 2	-	Group 1	Relay 1, 2 & 3	-	Group 1
Relay 3 & 4	-	Group 2	Relay 4 & 5	-	Group 2
Relay 5	-	Group 3			

The relay NO-C-NC labels represent the relay terminals in the de-energised state.

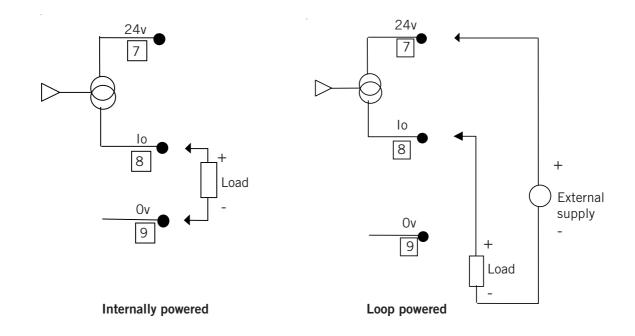

Note that, whilst each relay is individually double insulated, their arrangement is such that insulation between relays in the same group is standard or 'basic' insulation.

Care must be taken in order to avoid the risk of electric shock. It is not allowed to use relays in the *same Group* to control circuits with both mains and dc or low voltage circuits.

#### 3.8 Current Output

The current output may be connected in internally powered mode or loop-powered mode. See connections in Fig 10 below.

In Loop-powered mode an external power source is required. A minimum of 2.5V is required across terminals 7 and 8 for correct operation. The external voltage must not be more than 30V dc.

#### Figure 10 : Alternative current output configurations

3.9 Digital Control Voltage free contact inputs

There are 2 trigger inputs IN1 and IN2. The digital trigger input is connected as shown below:

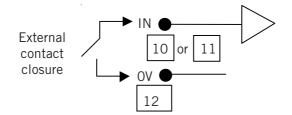

Figure 11 : Connection for external trigger input

#### 3.10 RS232

The RS232 connections (Terminals 4-6) may be used for exchanging data with a PC or handheld device. The configuration of the Control Unit may be read or modified using an application such as Mobrey H-Conf401 running on a PC.

For the MCULOG, the logged data is downloaded from the RS232 port via a socket connection provided, using Mobrey LogView running on a PC.

4 Rx 5 Tx 6 OV

#### 4.0 Maintenance / Inspection

#### CONTROL UNIT

No maintenance is required beyond occasional cleaning of the enclosure with a damp cloth. Solvents or bleaches should not be used. Do not modify or attempt to repair the unit.

Check lid and glands are tight, also check unit for damage and if damaged do not use.

#### 5.0. Accessories

#### Rack mounting kit for MCU900P Panel Mounting models.

Comprises one pre-cut aluminium panel, dimensions 128.5mm high x 213mm wide x 2.5mm thick predrilled and supplied with 4 captive screws and bushes to allow fitting in a standard 19" Rack. (3U x 42HP) Specify Mobrey part number MSP-RMK1 (one per MCU900P)

#### IP65 Hood for IP65 sealing of MCU900P Panel Mounting models.

Comprises a transparent hood which is positioned over the fascia of the MCU900P and which is secured in place when the control unit is clamped into the panel. Note that 2 extra clamps/clips are required as detailed below.

#### **APPENDIX** 1

#### Introduction to programming the MCU900

The following few pages give a brief introduction to programming the MCU900. More detailed information is given in the Operation Manual IP2030/OM, available from Mobrey or by download from the Mobrey Measurement website at <u>www.mobrey.com</u>.

#### A1 The MCU900 keypad and menu navigation

The 4 red/white arrow keys are used to move around the menu structure, and the yellow enter key to confirm data input. The red Esc key allows a backward step to the previous screen.

Practice now using the keypad to customise the system settings in the MCU900. You may like to set the date, time and language of the display.

- Press the enter key to display the Main Menu.
- Press the down arrow once to highlight "SETUP" and press the enter key. (Note the beep which confirms each key press)
- Select "MCU CONTROL UNIT" and press the enter key to reveal the "SETUP" menu.
- Use the down arrow to move down the list. Note that there are more than the three items shown in the list, as indicated by an arrow pointing down in the lower right of the screen. Highlight "SYSTEM" and press the enter key.
- The SYSTEM menu comprises 6 items. Press the down arrow several times, or the right arrow once, to highlight "SETTINGS" and press the enter key.
- Select "Time" and press the enter key. You may now edit the time if appropriate.
- Press the enter key which will highlight the first "hours" digit. Use the up and down arrows to select the correct value then press the right arrow to move to the next digit. Continue until the time shown is correct, then press the enter key to save the time shown. Press Esc to jump back to the "SETTINGS" screen and select another setting to customise as appropriate, for example, display language.
- Once the MCU900 has been customised to your satisfaction, press the Esc key repeatedly to return to the main display screen.
- A2 Programming the MCU900 for your application

The MCU900 is capable of complex control functionality, much of which is specific to certain duties. To programme the MCU900 for a specific application, it has to be told what the application is and then certain application details to allow the MCU900 to perform the necessary calculations.

To assist the user in understanding MCU900 programming, it is convenient to imagine these application specific data to be stored in memory locations called "Parameters", each of which has a unique address. Not all parameters are necessary for each application.

Programming the correct parameters for your particular application is made easy by Mobrey "Wizards", which navigate the user around the menu structure and request only the data needed for your chosen application.

A listing of the MCU900 parameters, their location in the menu structure and their units / default values is given at the rear of this manual. Also, the parameter listing for the Mobrey MSP900SH is given, as this is a popular choice of transmitter to use with this MCU900 control unit.

#### You are strongly recommended to use these Wizards whenever possible.

Before the Mobrey wizards are explained in more detail, it is important that the user understands the input to the MCU900 and what is being shown on the display.

A2.1 Understanding the input to the MCU900 and what is shown on the display.

The MCU900 may be used with either a 4-20mA transmitter or a digital HART transmitter.

A2.1.1 Using a transmitter with a standard 4-20mA output.

Any transmitter with a 4-20mA output may be connected to the MCU900. Exactly what this 4-20mA represents is a function of the transmitter. The transmitter can not be re-ranged by the MCU900.

For example, if a level transmitter designed to give a 4-20mA output over 5m is installed in a 3m deep tank, the input to the MCU900 is going to be 4-13.6mA.

When a standard 4-20mA transmitter is connected, the MCU900 will recognise the input and the PV shown on the main display will be in % of current input, where 4mA is 0% and 20mA is 100%. Note, in the example above, the maximum current that the MCU900 will see will be 13.6mA, so the PV on the display will only ever show 60% maximum.

It is possible to scale this input in the MCU900 and give a 4-20mA output from the MCU900.

#### A2.1.2 Using a HART compatible transmitter

Any HART compatible transmitter can be connected to the MCU900. The MCU900 will recognise a HART transmitter and automatically start digital communications. The PV shown on the display will be extracted directly from the transmitter, along with the associated measurement units.

You will notice a small "~" icon next to the padlock in the upper left corner of the display which shows digital communications are in operation.

#### A2.1.3 Using the MCU902

The MCU902 accepts inputs from two HART transmitters arranged in multi-drop mode. Transmitters **MUST BE** HART compatible to be used with the MCU902. See Section 3.4.1.

A2.2 Using Mobrey Wizard assisted programming

With a transmitter connected and operating, you should now tell the MCU900 what duty it is to perform – Wet well pump control, Level measurement, Contents measurement or Flow measurement.

- Press enter and navigate to the Duty Wizard selection screen "SETUP / MCU900 CONTROL UNIT / DUTY (mode) / Duty Wizard.
- Press enter to start the duty wizard and select the duty for the MCU900
- Enter data as requested by the MCU900, which will automatically set up the input scaling and current output of the MCU900.

At the end of any duty wizard you will automatically be offered further wizards which are appropriate to you chosen application. For example, the "MCU Relay WIZARD", which allows you to set up relay control or alarm points as required, or the "TOTALISER WIZARD" relevant to open channel flow measurement and totalisation.

Further details of Mobrey Wizards are given in the system Quickstart manual IP2040/QS and the technical manual IP2030/OM available on request or from the website.

#### A2.3 Useful programming information

The following information is given to assist users in programming other popular functions of the MCU900.

#### A2.3.1 Password protection

The MCU900 may be protected from unauthorised programming by setting a PIN number. Follow the path "SETUP / MCU CONTROL UNIT / SYSTEM / SETTINGS / PIN" and enter a 4 digit PIN.

#### A2.3.2 Configure the display

The MCU900 display may be customised to show a variety of data. The display is sectioned into 3 horizontal zones, Upper, Middle and Lower.

Follow the path "SETUP / MCU CONTROL UNIT / OUTPUT / DISPLAY" and select which part of the display you wish to customise. You may then select from a list of data which may be displayed there.

#### A2.3.3 Set up a digital input

Two voltage free contact inputs may be connected to the MCU900 and be programmed to cause certain actions should they activate.

Follow the path "SETUP / MCU CONTROL UNIT / DIGITAL INPUT / Digital Input 1 " and you can then customise the input to suit your requirements.

#### A2.3.4 Commissioning aids

The MCU900 has several useful commissioning aids on-board.

Follow the path "SETUP / MCU CONTROL UNIT / SYSTEM / TEST " and you can choose to autocycle the MCU900 over the full range of the current input without changing the transmitter input or level in a tank, trim input and output currents or use the MCU to drive a set output current into the loop.

#### A2.3.5 Re-setting default values

If the MCU900 is not operating as you would expect or you are unsure of some of the data you have programmed in, you can re-set the MCU900 to it's factory default condition. This action causes default values to be loaded into all of the MCU900 parameter locations. Note, all previously entered data will be overwritten or lost.

Follow the path "SETUP / MCU CONTROL UNIT / SYSTEM / DEFAULTS" and follow the instruction to load defaults.

#### A2.3.6 Direct parameter access

Proficient users who become familiar with the parameter numbers of the MCU900 can access parameters directly by parameter number.

Follow the path "DIRECT" and select either Pxxx or Dxxx. "D" type parameters are diagnostic parameters and are read only.

Once a parameter number is entered and displayed, the user can use the up and down keys to scroll through the full parameter list.

A2.3.7. Programming menus A2.3.7.1 Menu structure and parameter list for the MCU901/MCULOG
