## Signal Converters

795x series Signal Converters are easy-to-use units designed to process signals from Solartron density or viscosity transducers and live temperature and pressure inputs. They are supported by a PC-based utility for configuration, data logging and archiving, and are simple to interface with your process and plant systems. Built-in calculations include transducer correction, calculation of line or referred density, °API, °Baume, °Brix, calorific value, Wobbe Index etc

### Installation Drawing

Preferred installation is vertical with flow upwards. For slurries flowrate should be reversed.

Typical flowrates are 4000litr/hr.  
Maximum flowrate is 15000litr/hr.

Flow rate should be kept high to prevent gas bubbles and sediment from forming on the resonant tube. For best performance rigidly install 0.5g vibration max.
